For harder to fill parts temperatures may have to be increased. Keep lower temperatures in the rear zones to allow venting through the hopper.

Melt Temperature
Maximum temperature with a hand pyrometer should be 420º F to 460º F (215º C to 237º C).

Mold Temperature
Typically 80º F to 110º F (26º C to 43º C).

Injection Pressure
The preferred range is 50 to 60% of machine capacity. Pressure might be higher because this is a lower flow material.

Holding Pressure
Setting should be lower than boost pressure with a minimum amount of time to prevent over-packing of the part.

Injection speed
Slow to medium speed to prevent excessive shear on the material.

Cushion
Maintain at 0.25’-0.5” (6mm-12mm) to provide enough material for consistent parts.

Decompression
Use only when necessary to prevent nozzle drool.

Screw RPM
Screw should stop 1 to 2 seconds before mold open. A lower RPM is preferred for mixing and uniform melt temperature.

Drying
Material should be dried for a minimum of 2 hours and a maximum of 4 hours at 212º F (100º C).
