</tr>
</thead>
<tbody>
<tr>
<td>400°F / 205°C</td>
<td>420°F / 215°C</td>
<td>390°F / 200°C</td>
<td>355°F / 180°C</td>
<td>340°F / 170°C</td>
</tr>
</tbody>
</table>

For harder to fill parts the temperatures may have to be increased. Keep lower temperatures in the rear zones to allow venting through hopper.

Melt Temperature
Maximum temperature with a hand pyrometer should be 365°F to 440°F. (185°C to 226°C)

Mold Temperature
Typically 80°F to 110°F. (27°C to 43°C)

Injection Pressure
The preferred range is 20 to 60% of machine capacity. Pressure should be sufficient to fill the mold without hesitation or flashing.

Holding Pressure
Setting should be lower than boost pressure with a minimum amount of time to prevent over-packing of the part.

Injection speed
Slow to medium speed to prevent excessive shear on the material.

Cushion
Maintain at 5-10mm to provide enough material for consistent parts.

Decompression
Use only when necessary to prevent nozzle drool.

Screw RPM
Screw should stop 1 to 2 seconds before mold open. A lower RPM is preferred for mixing and uniform melt temperature.

Back Pressure
Higher than normal backpressure should be used to ensure adequate color dispersion. This is only recommended when using a pigment master batch.
